### Statement of the President

I got involved in the ammunition manufacturing business because DRT is truly a revolutionary product. To steal a phrase from Don Mikko, it is the first change in ammunition for at least 100 years, since the invention of smokeless powder. Frangible ammunition has been around for a while with a bad reputation, did not come apart and was not very accurate. This product puts to rest both of those problems. It is extremely accurate at long ranges and returns to its original powder state having tremendous terminal damage. The ammo has many advantages compared to traditional projectiles and several different applications. It is currently accepted by law enforcement and special government agencies. It has been used by spec. ops in conflicts around the world for 10 years. This will be the first time it will be offered to the hunting world.

I will attempt to explain why our ammo works and within the web site you will see evidence of what I am saying. We start with making of the jacket on the same machine that makes the entire bullet. Our jackets have centricity of less than two tenths of one thousandths. That has never been done in the ammunition world. We inject a core of tungsten, it does not compress. When we finish this process, we make a bullet with perfect spin stability. We then combine the bullet with prepped brass. By prepped I mean, sized, cut to length, and weighed for a perfect match. Our neck size is within one half of a thousandths. We measure our powder to three tenths of a grain. As you can see, this is what makes our bullet fly. Now to the frangibility. Our bullet is encapsulated in cooper just like others, but we use a core of tungsten not lead. We start with a fine mesh to make the core, it has been said much like the mesh of face powder. The hollow point acts like a hydraulic system once it hits the liquid in soft tissue and peels away the jacket to expose the fine dust rotating at high speeds. There are no large chunks, just fine dust doing the terminal damage.

Thanks for your interest in DRT and I hope you try our product. A skeptical famous writer used our product in Africa on a field testing trip and said something that stuck with me, "give a hunter one cartridge and you will have a customer for life." I hope you try our product.
